6G Computing Architecture: Distributed, Software Defined Accelerated and AI-enabled

Shiku Hirai, NTT Network Service Systems Laboratories

Rajesh Gadiyar, NVIDIA

NVIDIA Delivers Best Value 5G DataCenter

High Performance | High Utilization | AI Native

EFFICIENT PERFORMANCE

Power : Watts/Gbps
Cost : \$/Gbps

MULTI-TENANCY

Highest utilization & ROI

AI MONETIZATION

Increase revenue with same assets
Reduce OPEX with AI optimization

SW Defined, Scalable and Accelerated DC for 5G adv. and 6G

<6G>

Hyper-scaler's cloud

UPF is one of the key functions to link mobile and service domains.

→ Distributed UPF (dUPF) on DPU (BlueField-3)
- Lightweight, high-performance, energy-efficient and reliable

Dynamic control of vRAN and MEC unified platform.

→ End-to-End HW Acceleration leveraging MGX GH200
- Including mobile access, core, and apps

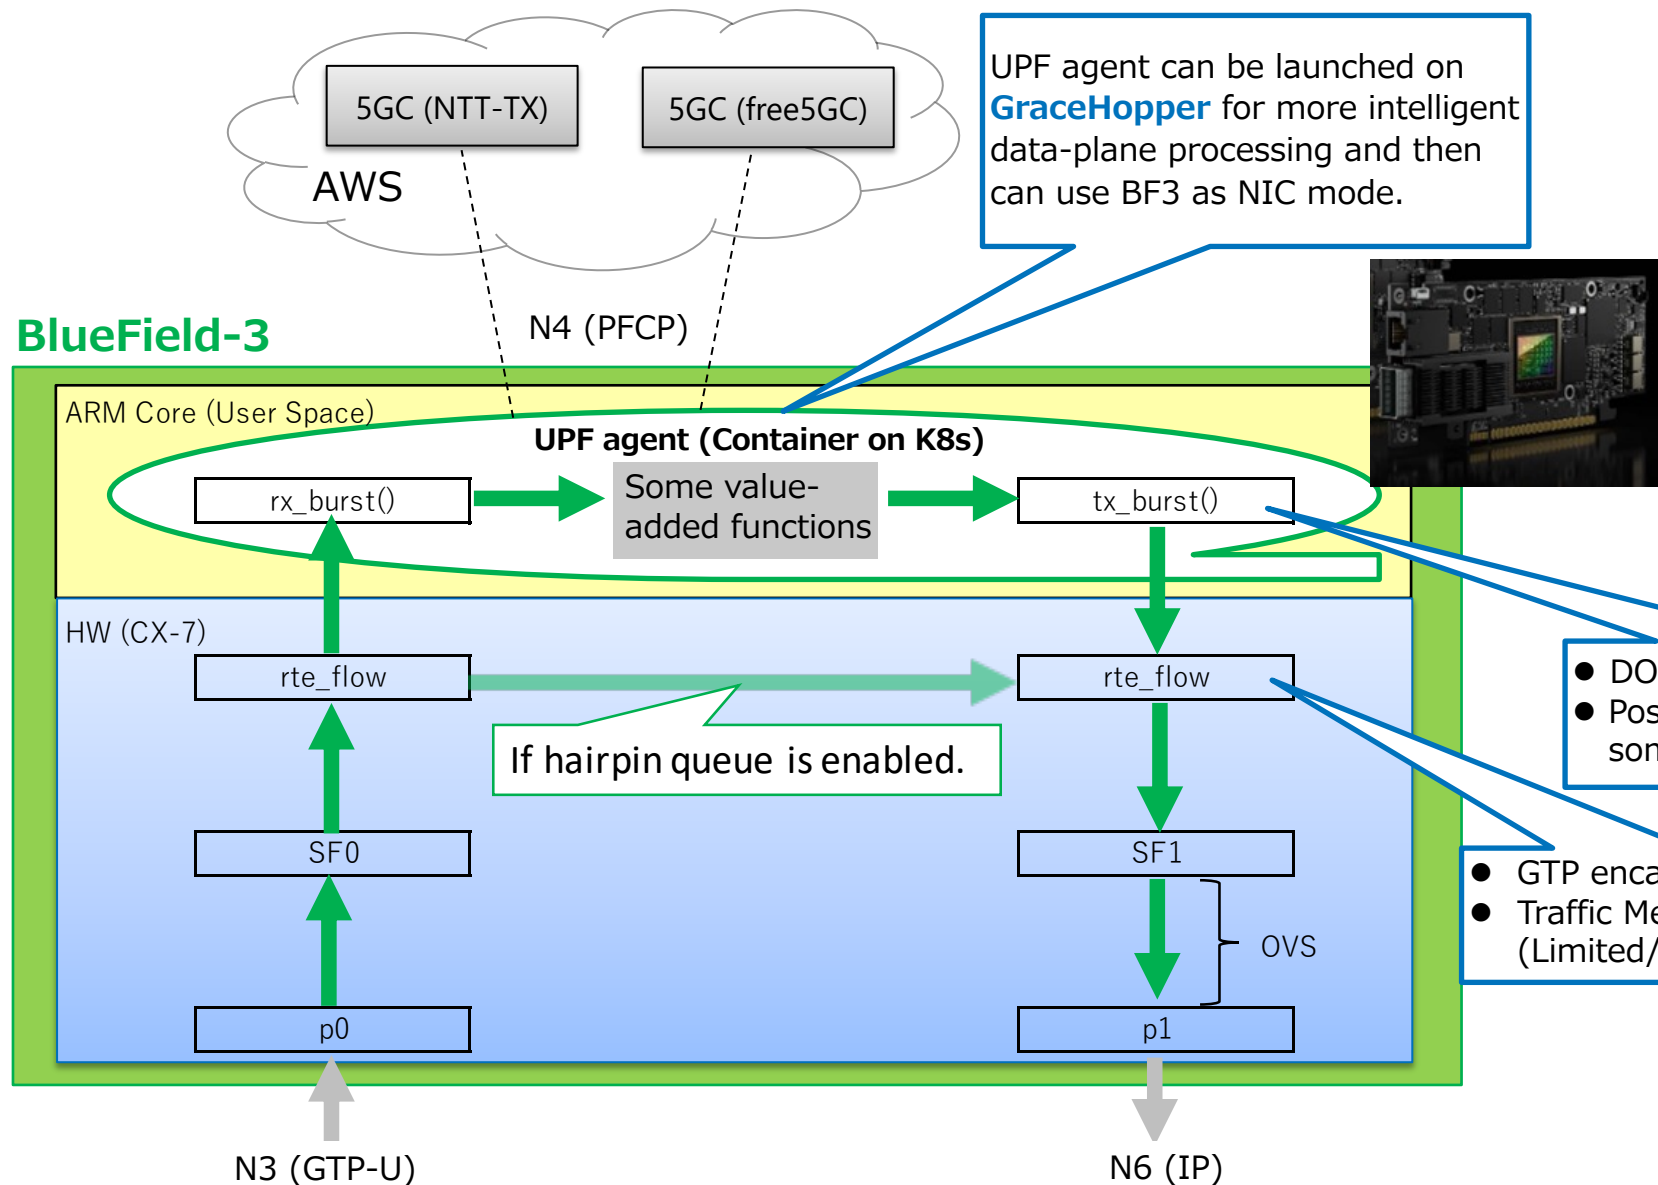

Far Edges

INC: In-Network Computing
UPF: User Plane Function
vRAN: virtualized Radio Access network

Introduction of related research activities

- **dUPF Implementation on DPU (BlueField-3)**
- **End-to-End HW acceleration leveraging MGX GH200 Platform**

dUPF Architecture on DPU (BlueField-3)

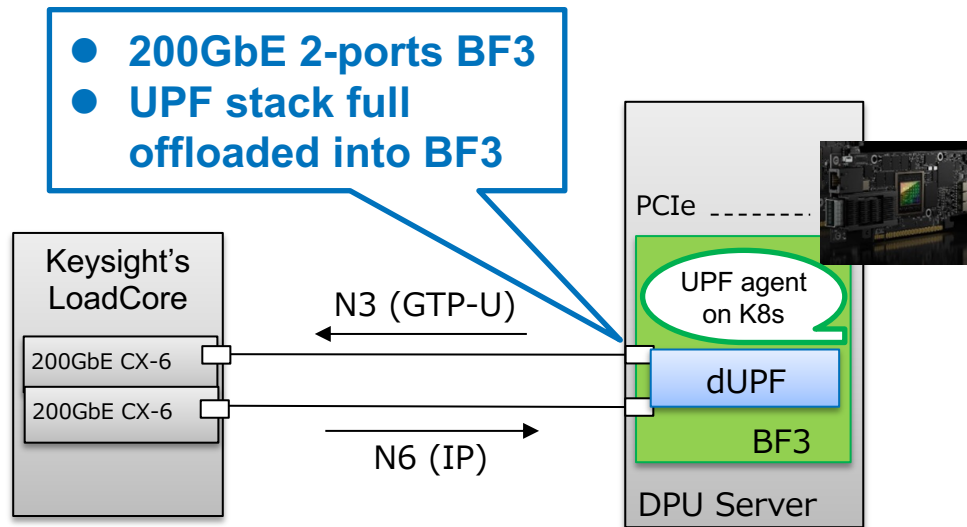

| Feature | Support |
|------------------------------------|---------|
| QoS | ● |
| DPI | ● |
| N4 (PFCP) | ● |
| Paging | - |
| Charging | - |
| Roaming | - |
| Uplink Classifier (Multi-step UPF) | - |

- DOCA Sending/Receiving API
- Possible to be combined with some value-added functions

- GTP encap/decap
- Traffic Metering for QoS (Limited/Guaranteed Bit Rate)

5GC: 5G Mobile Core
QoS: Quality of Service
DPI: Deep Packet Inspection
PFCP: Packet Forwarding Control Protocol
GTP: GPRS Tunneling Protocol

Performance Evaluation #1

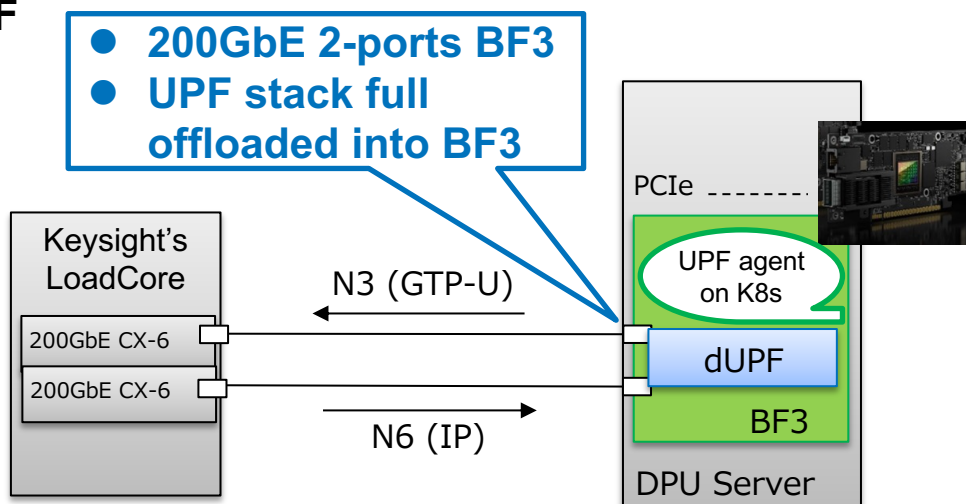

Performance Evaluation #2

(a) vUPF

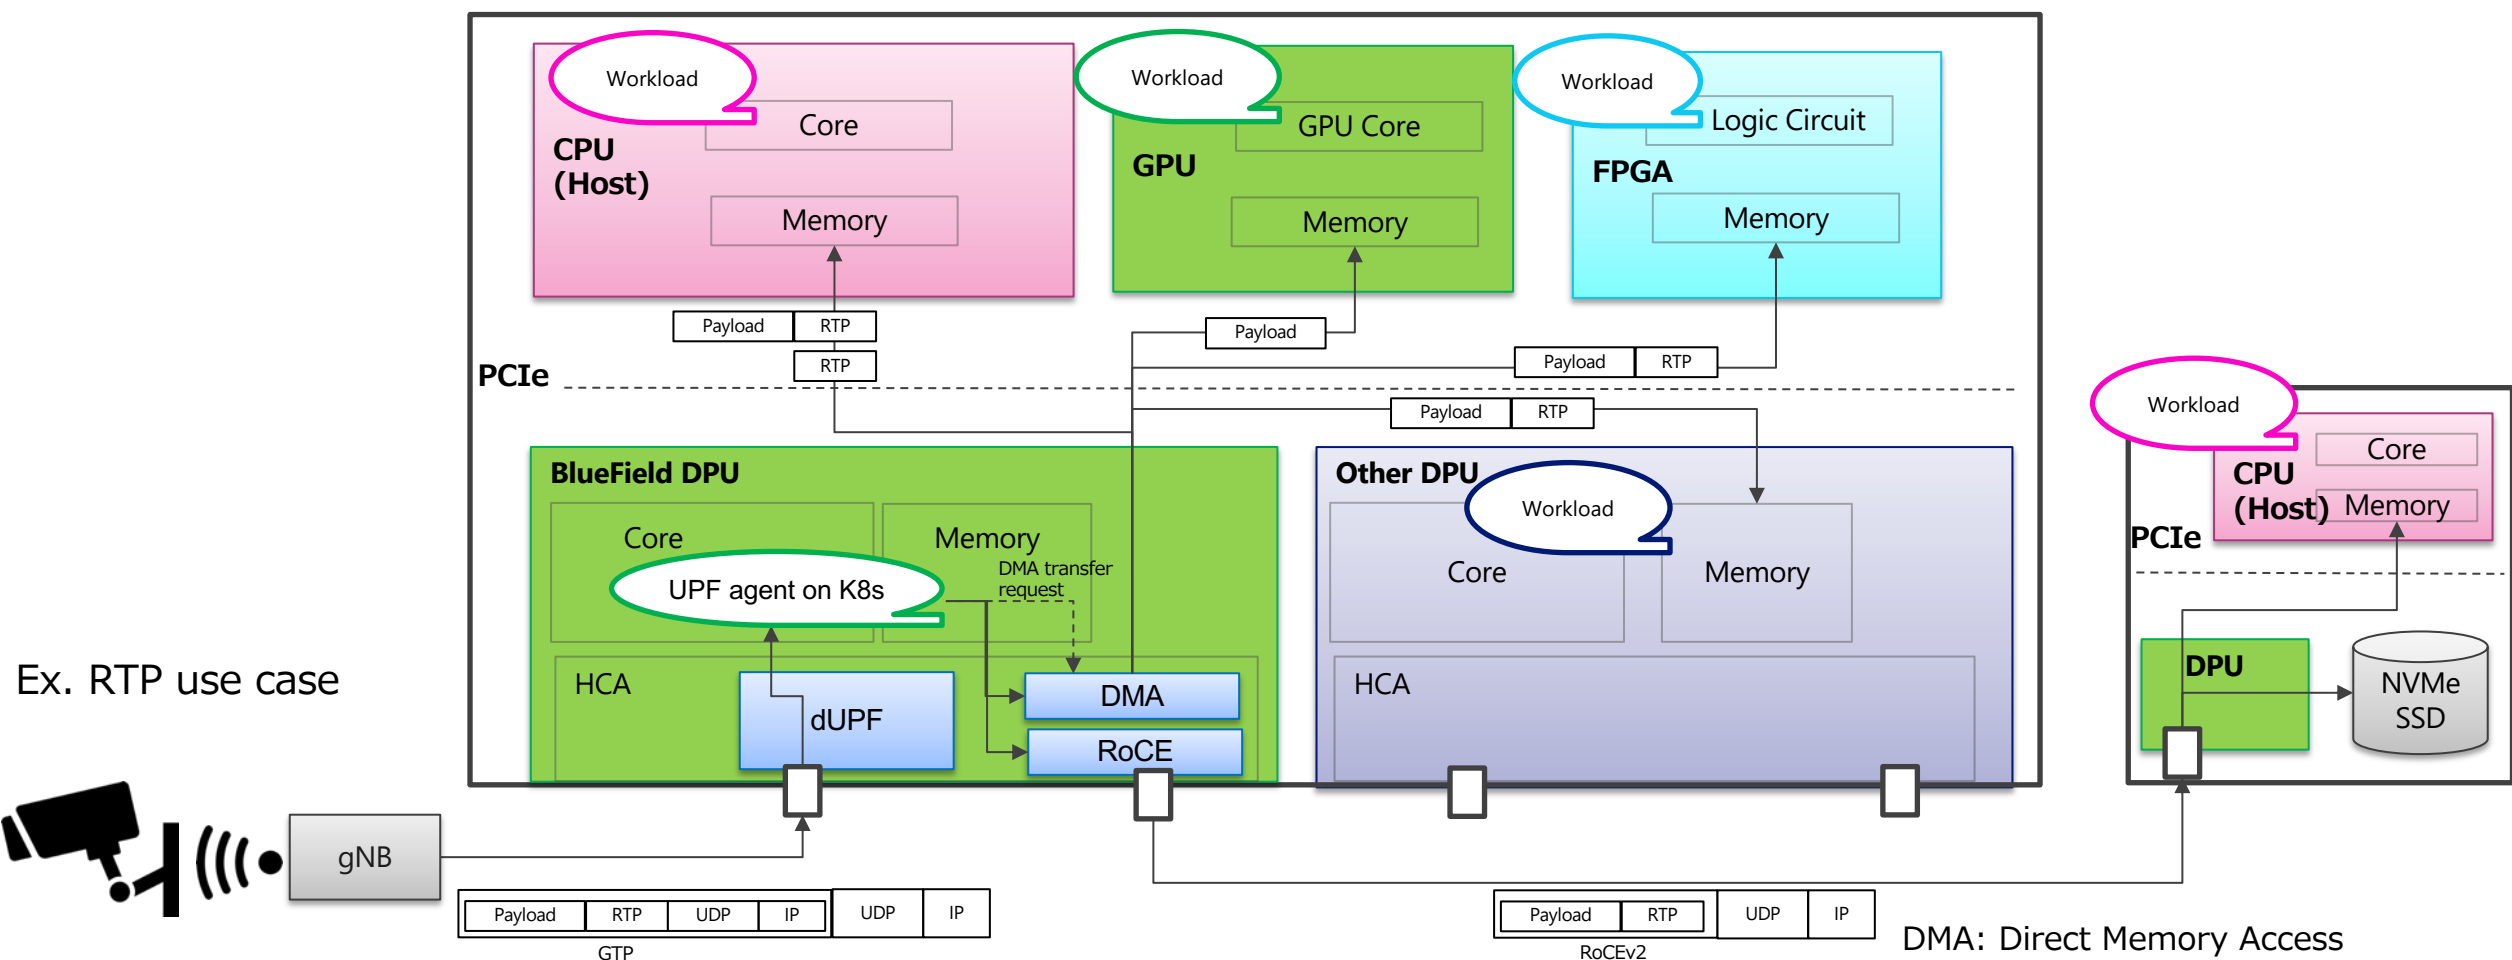

(b) dUPF

Planned Future Development

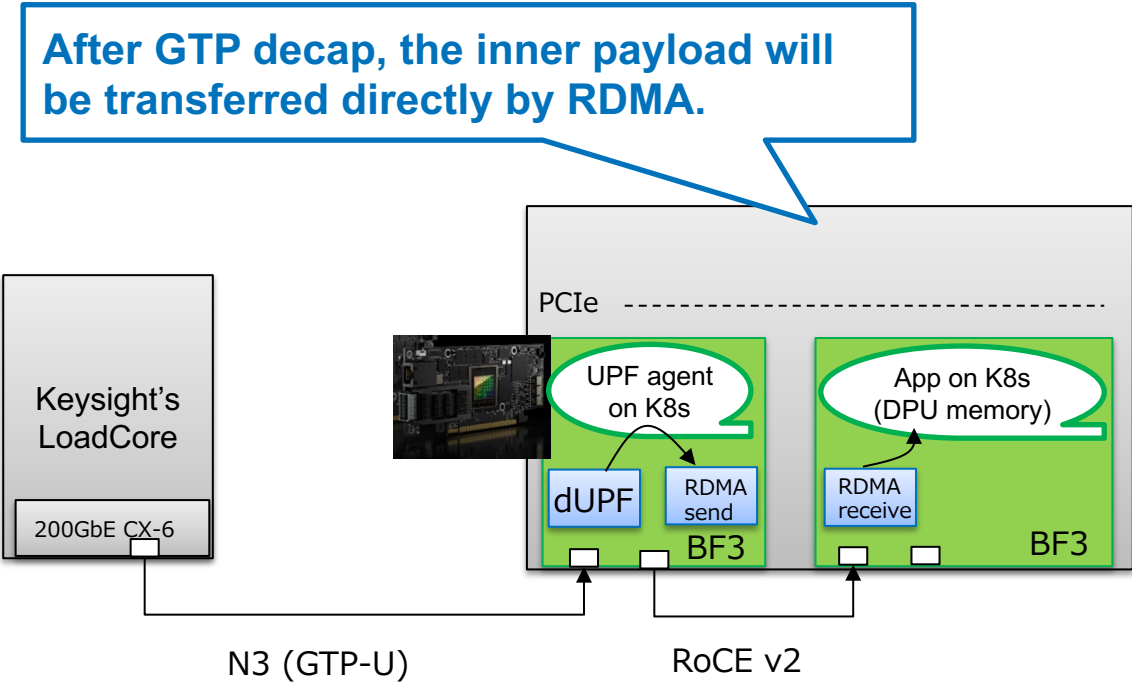

Advanced data processing based on memory-centric architecture

Ex. RTP use case

Combining UPF with RDMA function

Prototype that combines UPF with RDMA using DOCA RDMA Library

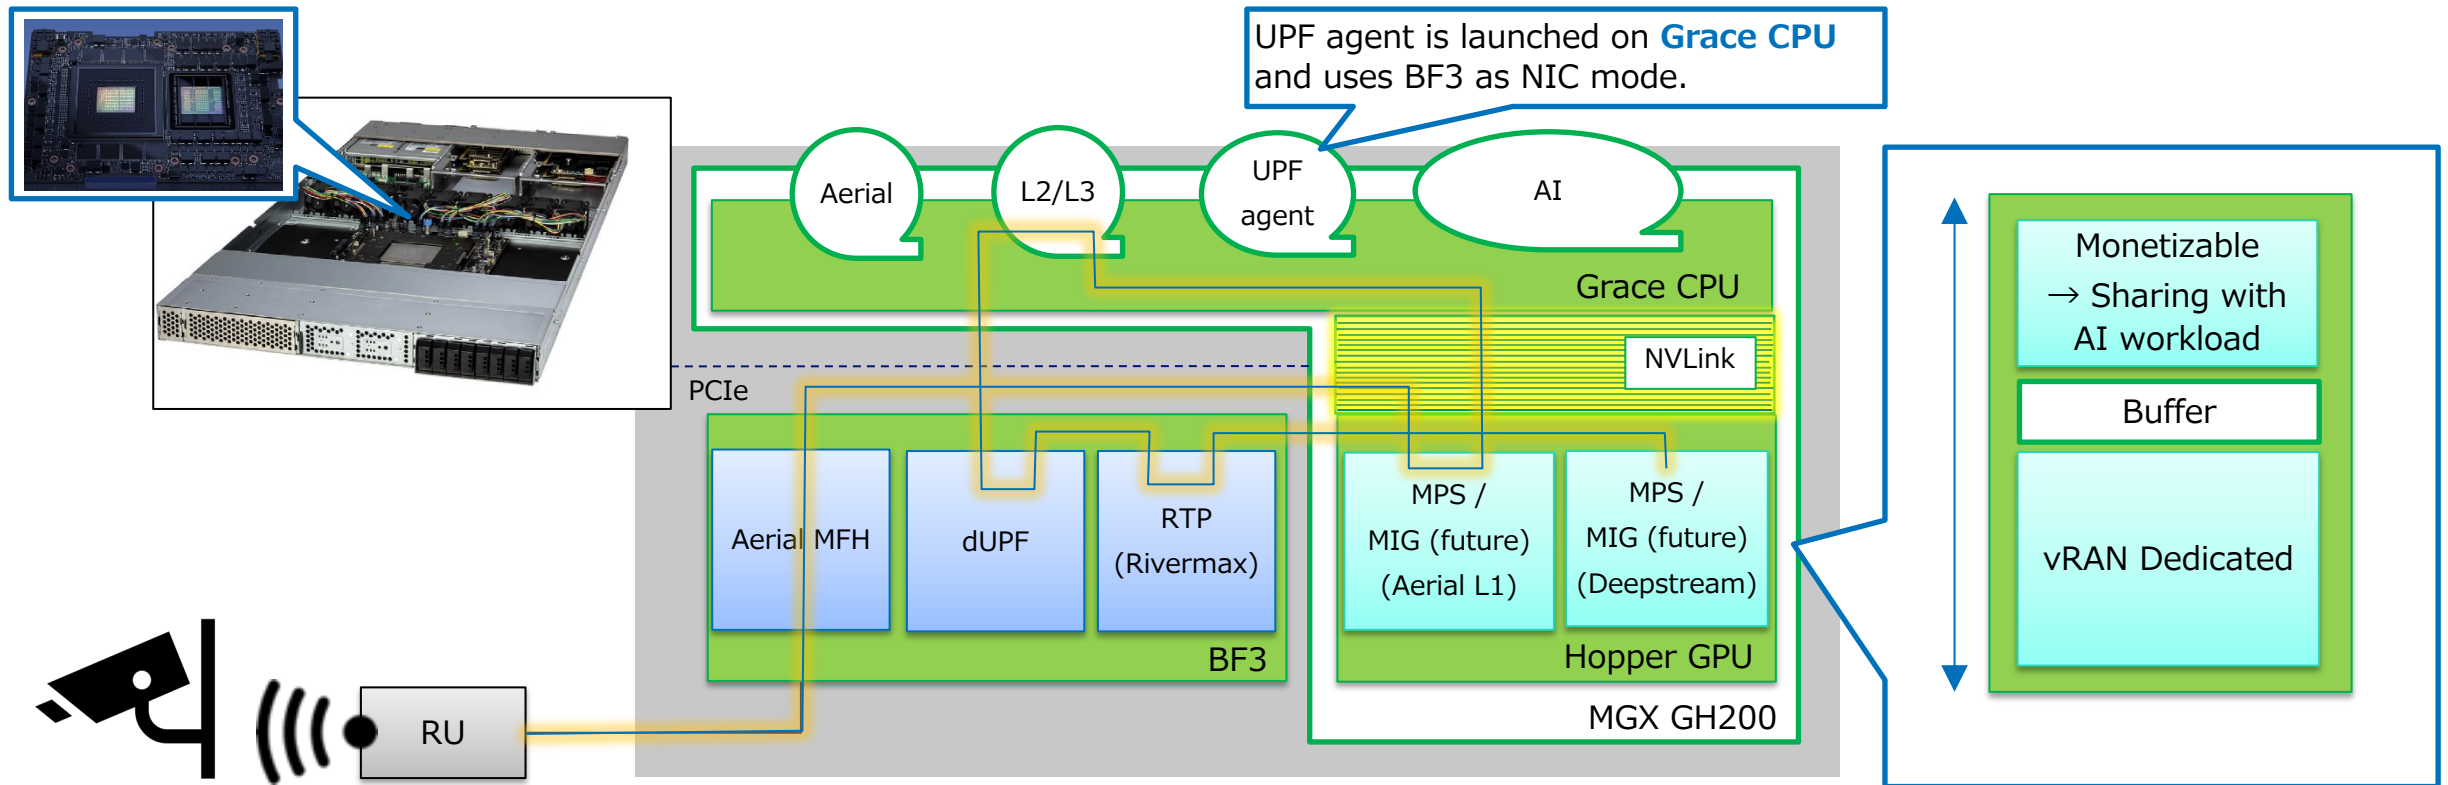

Number of N3 received packets that are bundled in one RDMA transmission

E2E acceleration leveraging MGX GH200 Platform

Dynamic control of vRAN and MEC unified platform:

End-to-End HW acceleration including mobile access, core, and apps

AI video analysis

(base) vran@gh200-01:~\$ docker ps

- NTT Labs is working on designing future 6G network architecture.
- dUPF is a key function to connect mobile and service domains in the distributed architecture. BlueField DPUs have the capability to realize lightweight, high-performance, energy-efficient, and reliable dUPF.
- E2E acceleration and resource sharing between multiple applications are important requirements for telecom operators toward 6G. We expect the high performance and flexible infrastructure like MGX GH200 in the age of AI-native.
- We will input our efforts to related standardization and OSS communities such as 3GPP, ESTI NFV, O-RAN, and LF OPI ,etc.
